IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) A method for paging a target mobile station (MS), the method comprising:

receiving information destined for the target MS;

paging the target MS at a paging area that is centered at a cell, in which the target MS last registered, and expands by a predefined number of cells around the cell; and

receiving registration from the MS when a number of cells identified in a first list is equal to a predetermined limit and the MS having moved the cells identified in the first list, other than a cell in which the MS last registered, to a second list.

- 2. (Original) The method of claim 1, further including sending the information to the target MS, if the target MS is located.
- 3. (Original) The method of claim 2, further including determining a neighboring base station controller (BSC) that can locate the target MS, if the target MS is not located.
- 4. (Original) The method of claim 3, further including sending the information to the neighboring BSC that locates the target MS for delivery to the target MS.
- 5. (Original) The method of claim 3, further including determining whether a mobile station controller (MSC) can locate the target MS, if no BSC connected to the MSC could locate the target MS.
- 6. (Original) The method of claim 5, further including sending the information to the MSC for delivery to the target MS, if the MSC locates the target MS.
- 7. (Currently Amended) A computer-readable medium comprising at least one instruction, which, when executed by a machine, cause the machine to perform operations for paging a target mobile station (MS), the instruction comprising:

a set of the instructions to receive information destined for the target MS;

a set of the instructions to page the target MS at a paging area that is centered at a cell, in which the target MS last registered, and expands by a predefined number of cells around the cell; and

a set of instructions to receive registration from the MS when a number of cells identified in a first list is equal to a predetermined limit and the MS having moved the cells identified in the first list, other than a cell in which the MS last registered, to a second list.

- 8. (Previously presented) The computer-readable medium of claim 7, further comprising a set of instructions to send the information to the target MS, if the target MS is located.
- 9. (Previously presented) The computer-readable medium of claim 8, further comprising a set of instructions to determine a neighboring base station controller (BSC) that can locate the target MS, if the target MS is not located.
- 10. (Previously presented) The computer-readable medium of claim 9, further comprising a set of instructions to send the information to the neighboring BSC that locates the target MS for delivery to the target MS.
- 11. (Previously presented) The computer-readable medium of claim 9, further comprising a set of instructions to determine whether a mobile station controller (MSC) can locate the target MS, if no BSC connected to the MSC could locate the target MS.
- 12. (Previously presented) The computer-readable medium of claim 11, further comprising a set of instructions to send the information to the MSC for delivery to the target MS, if the MSC locates the target MS.
- 13. (Currently Amended) An apparatus for paging a target mobile station (MS), comprising:

means for receiving information destined for the target MS;

means for paging the target MS at a paging area that is centered at a cell, in which the target MS last registered, and expands by a predefined number of cells around the cell; and

means for receiving registration from the MS when a number of cells identified in a first list is equal to a predetermined limit and the MS having moved the cells identified in the first list, other than a cell in which the MS last registered, to a second list.

- 14. (Original) The apparatus of claim 13, further including means for sending the information to the target MS, if the target MS is located.
- 15. (Original) The apparatus of claim 14, further including means for determining a neighboring base station controller (BSC) that can locate the target MS, if the target MS is not located.
- 16. (Original) The apparatus of claim 15, further including means for sending the information to the neighboring BSC that locates the target MS for delivery to the target MS.
- 17. (Original) The apparatus of claim 15, further including means for determining whether a mobile station controller (MSC) can locate the target MS, if no BSC connected to the MSC could locate the target MS.
- 18. (Original) The apparatus of claim 17, further including means for sending the information to the MSC for delivery to the target MS, if the MSC locates the target MS.
- 19. (Currently Amended) A base station controller (BSC) for paging a target mobile station (MS), comprising:
 - a receiver operable to receive capable of receiving information from a target MS;
- a transmitter <u>operable to transmit eapable of transmitting</u> information to the target MS; and
- a processor <u>operable to:</u> receive capable of carrying out a method for paging the target MS, comprising:

receive receiving information destined for the target MS;

page paging the target MS at a paging area that is centered at a cell, in which the target MS last registered, and expands by a predefined number of cells around the cell; and

receive receiving registration from the MS when a number of cells identified in a first list is equal to a predetermined limit and the MS having moved the cells identified in the first list, other than a cell in which the MS last registered, to a second list.

- 20. (Currently Amended) The base station controller of claim 19, <u>further operable to send the method further including sending the information to the BSC for delivery to the target MS</u>, if the BSC locates the target MS.
- 21. (Currently Amended) The base station controller of claim 20, <u>further operable to determine the method further including determining</u> a neighboring BSC that can locate the target MS, if the BSC could not locate the target MS.
- 22. (Currently Amended) The base station controller of claim 21, <u>further operable to send the method further including sending the information to the neighboring BSC that locates the target MS for delivery to the target MS.</u>
- 23. (Currently Amended) The base station controller of claim 21, <u>further operable to determine</u> the method further including determining whether a mobile station controller (MSC) can locate the target MS, if no BSC connected to the MSC could locate the target MS.
- 24. (Currently Amended) The base station controller of claim 23, <u>further operable to send the method further including sending the</u> information to the MSC for delivery to the target MS, if the MSC locates the target MS.
